

1. Code Structure

My project is one single file called index.html. There are no external CSS files or JavaScript files used, as required by the assignment. The page starts with DOCTYPE html which tells the browser this is an HTML5 page. The head section contains the page title and character encoding. All the newspaper content is inside the body tag, wrapped in a main container that centers the page and gives it a newspaper look.

2. Key Sections

The header section contains two things. First, a top bar showing the volume number, date, and price. Second, a black background banner with the main headline in large white text using the h1 tag.

The main content uses three HTML tables. The first table creates three columns for the logo, president photo, and main article. The second table shows the war photo on the left and enemy losses on the right. The third table at the bottom shows the map, China's statement, and world reaction.

Each news story is wrapped in an article tag because it is a self-contained piece of content. The footer tag at the bottom contains my name, roll number, and navigation links.

3. Design Decisions

I used tables for the column layout because they create reliable side by side columns in pure HTML without needing any external CSS file. I used inline styles on each tag for all the formatting like colors, borders, and font sizes. I used tags like header, article, section, and footer because they describe the purpose of the content clearly, which is better HTML practice. I used a ul tag for the Enemy Losses section because a bullet point list is the most natural way to show that kind of information.

4. Challenges

The hardest part was making the newspaper look like three separate columns using only HTML tables and no CSS framework. I fixed this by setting width percentages on each table cell and adding border lines between columns using inline styles
